This volume on botanical research in tundra represents the culmination of four years of intensive and integrated field research centered at Barrow, Alaska. The volume summarizes the most significant results and interpretations of the primary producer projects conducted in the U.S. IBP Tundra Biome Program (1970-1974). Original data reports are available from the authors and can serve as detailed references for interested tundra researchers. Also, the results of most projects have been published in numerous papers in various journals. The introduction provides a brief overview of other ecosystem components. The main body presents the results in three general sections. The summary chapter is an attempt to integrate ideas and information from the previous papers as well as extant literature. In addition, this chapter focuses attention on processes of primary production which should receive increased emphasis. Although this book will not answer all immediate questions, it hopefully will enhance future understanding of the tundra, particularly as we have studied it in Northern Alaska.

Around Australia's highest mountain lies a rare ecosystem, an alpine area of outstanding beauty and diversity, strikingly different from other alpine ecosystems of the world but with common features. Kosciuszko Alpine Flora describes and illustrates the area's 212 flowering plants and ferns, of which 21 are endemic. It discusses the geological and human history of the area, the life-forms and habitats of the plants, and explores the various plant communities and their environmental relationships. Ideal for the tourist or general interest reader, this field edition excludes the detailed taxonomic section.

"Department of Life Sciences, Natural History Museum, London, UK. We are living in an age where biodiversity is being lost at an unprecedented rate, with the well-documented problems of habitat destruction being compounded by the largely unknown future effects of Climate Change. High quality, accurate and reliable biodiversity data are needed by biologists, conservationists and environmental modellers to understand and assess the ecosystems in which they work, to produce effective conservation strategies, and to feed computer-generated models which predict what environments and

habitats we might face"--

When Catharine Parr Traill came to Upper Canada in 1832 as a settler from England, she brought along with her ties to British botanical culture. Nonetheless, when she arrived she encountered a new natural landscape and, like other women chronicled in this book, set out to advance the botanical knowledge of the time from the Canadian field. *Flora's Fieldworkers* employs biography, botanical data, herbaria specimens, archival sources, letters, institutional records, book history, and abundant artwork to reconstruct the ways in which women studied and understood plants in the nineteenth century. It features figures ranging from elite women involved in imperial botanical projects in British North America to settler-colonial women in Ontario and Australia - most of whom were scarcely visible in the historical record - who were active in "plant work" as collectors, writers, artists, craft workers, teachers, and organizers. Understood as an appropriate pastime for genteel ladies, botany offered women pathways to scientific education, financial autonomy, and self-expression. The call for more diverse voices in the present must look to the past as well. Bringing botany to historians and historians to botany, *Flora's Fieldworkers* gathers compelling material about women in colonial and imperial Canada and Australia to take a new look at how we came to know what we know about plants.

Ferdinand Jacob Lindheimer is known as the "father of Texas botany." While he was not the first botanist to collect plants for scientific examination in Texas, his collections are credited with helping botanists around the world to understand the nature, extent, and significance of the diversity of plants in the state. In partnership with Asa Gray of Harvard University, Lindheimer spent eight years collecting Texas plants to distribute to a list of paying subscribers—including places like the British Museum, the Royal Botanic Gardens at Kew, and the Smithsonian Institution. Today, no fewer than 362 plant names are based, at least in part, on Lindheimer collections, and 65 plants have been named in his honor. Lindheimer was a founding settler of New Braunfels, raising his family on the banks of the Comal River while he continued to collect and ship plant specimens. He was "elected" as the first editor of the *Neu-Braunfeler Zeitung* (still published today as the *Herald-Zeitung*),

and served from 1852 to 1872. He wrote a number of articles for the Zeitung on topics ranging from plants, climate, and agriculture to Texas Indian affairs, optimism, and teaching schoolchildren. In the last year of Lindheimer's life, one of his students worked with him to collect an assortment of his essays and articles from the Zeitung. In 1879, the collection was published as Aufsätze und Abhandlungen von Ferdinand Lindheimer in Texas (Essays and Articles of Ferdinand Lindheimer in Texas). John E. Williams now offers the first English translation of these essays, which provides valuable insight into the natural and cultural history of Texas.

Flora of the Pacific Northwest, first published in 1973, became an instant classic for its innovative style of providing species descriptions in the identification keys, and for its comprehensive illustrations of nearly all treated taxa (species, subspecies, and varieties). Students rely on it as an essential primer, while veteran botanists and natural resource managers use it as the definitive reference for the region's flora. This completely revised and updated edition captures the advances in vascular plant systematics over the decades since publication of the first edition.

These advances, together with significant changes in plant nomenclature, the description of taxa new to science from the region, and the recent documentation of new native and nonnative species in the Pacific Northwest required a thorough revision of this authoritative work. Flora of the Pacific Northwest covers all of Washington, the northern half of Oregon, Idaho north of the Snake River Plain, the mountainous portion of western Montana, and the southern portion of British Columbia. It accounts for the wild-growing native and introduced vascular plants falling within those boundaries and includes: Treatment of 5,545 taxa (more than 1,000 taxa added from the first edition) Illustrations for 4,716 taxa (1,382 more than the first edition) Nomenclature changes for more than 40 percent of the taxa included in the first edition These enhancements make this new edition the most comprehensive reference on Pacific Northwest vascular plants for professional and amateur botanists, ecologists, rare plant biologists, plant taxonomy instructors, land managers, nursery professionals, and gardeners.

The present book on the Biodiversity of Ranthambhore Tiger Reserve deals with 539 species of higher plants and 361 species of animals (vertebrates). Besides geographical position and topography, the abiotic components, viz. geology, soils, water, climatic conditions etc., which determine the composition of biota in an ecosystem, have been discussed in details. Correct and valid names have been adopted for the floral and faunal elements along with local and English names. The keys have been provided for plant species from infra-specific to family level for easy identification. The short diagnostic description, phenology, ecology and distributional aspects have been provided under each plant species. Besides statistical analysis of floral composition, the phytogeographical and biological spectra have also been worked out to determine the routes of migration and phytoclimate respectively. Bioperspective value of the Reserve has been assessed to determine the economic potentiality and sustainable utilization of bioresources. The faunal diversity includes vertebrate fauna only, arranged in a classified manner. The shelter and feeding habits along with dependency of fauna on vegetation have been provided to determine plant-animal relationship and flow of energy. Details about endemic and threatened species of plants and animals, along with causes of threats, have been given for proper management of the Reserve. About 107 colour

photographs of habitat and plants and animals with 36 illustrations of plant species have been provided. Several maps, pie charts, graphs, figures etc, along with data-tables, are appended to illustrate the findings. It is hoped that the book will prove a milestone in the management of the Reserve.

Although a self-taught botanist, Charlie Deam (1865-1953) once served as state forester for Indiana and is revered as a pioneer in the field of botany. He traveled more than 100,000 miles throughout the state in his lifetime collecting 73,000 plant specimens. His four volumes about the flora, grasses, shrubs, and trees of Indiana resulted, among other things, in three honorary degrees. Deam's herbarium and 3,000-volume botanical library are now housed at Indiana University.

The history of written records of native orchids in Taiwan began in 1857 with a British botanist. After more than 160 years of study by European, Japanese, and Taiwanese scholars and enthusiasts, the list of native orchids increased to more than 470 species, including natural hybrids and varieties. The author exerted extensive efforts to include all known species in this work and arranged them based on the order of subfamilies. Scientific names, synonyms, and relevant references are provided for each species. Many of the species are provided with additional explanations in the "note" section. The uniqueness of this book is the line drawing illustrations which emphasize the structure of the column. In total, 500 figures are presented to accompany the species descriptions. These extensive line drawings were accumulated since 1971 and were mostly drawn by the author. More than that, this book also presents the gynostemium structure of more than 380 species, including the stigma, pollinium, rostellum, and column, in high-resolution color plates.
