Old landfills are being mined for fuel, new landfills are designed to prevent waste materials from migrating to groundwater and new approaches to waste incineration focus on energy recovery and conversion of waste materials into usable materials. This

Packaging Ecology is the scientific study of the distributions, abundance and relations of organisms and their interactions with the environment. Ecology includes the study of plant and animal populations, plant and animal communities and ecosystems. Ecosystems describe the web or network of relations among organisms at different scales of organization. An ecosystem is a self-contained, dynamic

system made of a population of species in its physical environment. This concept is used to study the complex interactions between the organisms-plants, animals, bacteria, and fungi-that make up the community. There are many different ways in which the community of organisms interacts. Environment means everything around to a living being. Especially the circumstances of life of people or society in their life conditions.

It comprises the set of natural, social and cultural values existing in a place and at a particular time, that influence in the life of the human being and in the generations to come. Pollution is anything that makes the earth dirty and unhealthy. Land, air, and water are all affected by pollution. Pollution takes up space on our land. Many of the things people use every day come in packages, like food, games, school supplies, and electronics.

Wildlife tend our forests – they pollinate flowers, disperse seeds, eat insects that harm trees, and keep herbivores and diseases in check. They keep our forests healthy and resilient – ready and able to face and counter any

challenges, such as global warming and climate change. They are the individual cogs that keep the forest machine functioning. And we desperately need our forests – to sequester carbon, to purify our air and water, to protect our soils from getting eroded, and to save our dams and waterways. Wildlife do need our care, concern, and attention, but we

---

also need our wildlife – perhaps much more sincerely. A majority of wildlife arrived on this planet much before humans, and the Earth belongs to them as well. So how do we conserve wildlife? This is the question that Principles of Wildlife Conservation seeks to answer. It presents a lucid – cogent, yet simple – narration about the why's and how's of

conserving wildlife. It begins with the first principles – and thus requires no prerequisite other than an urge to seek knowledge. It is full of pictures and case studies from the field – to facilitate easy grasping of the subject. The book builds a solid foundation of the theory of wildlife conservation, and tops that up with experiences from actually doing

wildlife conservation. In this way, it equips the reader to master both the science – and the art – of conserving wildlife.
