The field of pain research is rapidly expanding in both human and veterinary medicine, and has helped increase our understanding of acupuncture.

However, many are still highly sceptical about the use of acupuncture and prefer for it to remain far from orthodox veterinary practice. This book seeks to challenge common misgivings by showing how veterinary acupuncture works (for small and large animals), and why it should be established as an orthodox form of treatment. Written from a Western approach, rather than a traditional Chinese Medicine approach, it explains the background and history of acupuncture and includes key information on safety aspects, understanding pain and how acupuncture can help, practical aspects such as types of needles and methods of restraint, and related techniques. Not intended as a techniques manual, this book is a preparatory text for those considering taking an acupuncture course and those wishing to gain a solid understanding of the subject.

- A hypothesis is a proposition, set forth as an explanation for the occurrence of a phenomenon, that can be tested. - The basis for scientific investigation is the collection of information to formulate and test hypotheses. - Experimental methods measure the effect of manipulations caused by the investigator; observational methods collect information about naturally occurring events. - There are three sub-types of experimental techniques that differ in the way subjects are chosen for inclusion in the study, in the amount of control that the investigator has over variables, and in the method used to assess changes in other variables. - Descriptive observational studies dominate the early phase of most investigations and involve the description of disease-related events in the population. Associations among factors may be observed but the strength of the associations is not measured. - Analytical observational techniques are of three basic types: prevalence surveys, case:control studies, and incidence or cohort studies. All attempt to explain the nature of relationships among various factors and to measure the strength of associations. - Prevalence surveys and case:control studies deal with disease existing at the time of the study; incidence studies are concerned with the development of disease over time. - Observational studies may be retrospective, using existing data, or prospective with collection of new information.

It provides a detailed discussion of the nature and causes of reading difficulties, which will help develop the knowledge and confidence needed to accurately assess why a student is struggling. This book provides an overview of the best assessment and intervention techniques, backed by the most current research findings. Bridge the gap between research and practice Accurately assess the reason(s) why a student struggles in reading Improve reading skills using the most highly effective evidence-based techniques Reading may well be the most important thing students are taught during their school careers.
