Western democracy is being questioned around the world. At the same time, Western aid groups are quick to say that they are not trying to impose a particular style of democracy on others and that they are open to supporting local, alternative forms of democracy. This book examines what it is about Western democracy that non-Westerners are reacting negatively to and whether the critics often are equating a dislike for certain Western social or economic features with an aversion to of Western political systems. It also explores the current state of debate about alternative forms of democratic practice in different regions—Asia, Africa, the Middle East, and Latin America—and then

puts forward ideas about how Western actors engaged in democracy support can do a better job of incorporating new thinking about alternative democratic forms into their efforts.

Annual Report of the Secretary of Internal Affairs of the Commonwealth of Pennsylvania
The changes occurring in the temperature field in the Somali Basin and off the Arabian coast have been monitored from October 1975 through December 1979 by a time series of temperature sections obtained along the tanker sea lane offshore between 2 S and 22 N. The development and decay of the large eddy (up to roughly 600 km in diameter) in the northern Somali Basin and its smaller associated eddies were observed each southwest monsoon. Strong horizontal thermal gradients particularly in the upper 200 m occur at the eddy boundaries, and currents in this region can attain velocities of up to 7 knots. Monthly wind stress contoured for the western Indian Ocean clearly shows the southwest monsoon from May through September (with values over 4 dynes/sq. cm during July) to be considerably stronger than the northeast monsoon with a maximum in January. Maps of wind stress curl during the southwest monsoon show a large region of negative curl (over -4×10 to the -8 th dynes/cc) to the northeast off the somali

coast, whereas a region of a high positive curl occurs off the Arabian peninsula and in a small band off the Somali east coast north of 5 N. Sverdrup mass transports of up to 40×10^6 to the $-12 \text{ m}^2/\text{sec}$ to the north off the Somali coast are in rough agreement with observed values. (Author).
