In this book, which focuses on the use of iterative methods for solving large sparse systems of linear equations, templates are introduced to meet the needs of both the traditional user and the high-performance specialist. Templates, a description of a general algorithm rather than the executable object or source code more commonly found in a conventional software library, offer whatever degree of customization the user may desire. Templates

offer three distinct advantages: they are general and reusable; they are not language specific; and they exploit the expertise of both the numerical analyst, who creates a template reflecting in-depth knowledge of a specific numerical technique, and the computational scientist, who then provides "value-added" capability to the general template description, customizing it for specific needs. For each template that is presented, the authors provide: a mathematical description of

the flow of algorithm; discussion of convergence and stopping criteria to use in the iteration; suggestions for applying a method to special matrix types; advice for tuning the template; tips on parallel implementations; and hints as to when and why a method is useful.

Sharpen your French grammar with skill-building exercises If you want to be proficient in French, you eventually have to clear the bothersome hurdle of grammar.

The best way to conquer this

obstacle is through hands-on experience. Covering all facets of French grammar--from prepositions and pronouns to verbal forms and tenses--French Grammar Drills helps you learn often-perplexing topics with fun and engaging exercises. This comprehensive book features: More than 150 exercises that demonstrate how the French grammar system works as well as review exercises to reinforce your learning An answer key to give you immediate clarification on any concept o Quick reviews bring you up to speed on grammar Topics include: Indefinite and definite articles * Demonstrative adjectives * Possessive pronouns * Conjunctions * Imparfait and

pass é composé * Verbal expressions and idioms * and more

does this by developing
a series of striking

development, mainly
due to Alain Connes,

is providing an increasing number of applications and deeper insights for instance in Foliations, K-Theory, Index Theory, Number Theory but also in Quantum Physics of elementary particles. The purpose of the Summer School in Martina Franca was to offer a fresh invitation to the subject and closely related topics; the contributions in this volume include the

four main lectures, cover advanced developments and are delivered by prominent specialists.

Absurd fairy tales, very sensibly told
There once was a good little devil - did you read that right? Yes you did: not a wicked little devil but a good one, and boy, was he in a fix! Instead of doing bad things like forgetting his homework and playing

tricks on his teachers, this little devil kept trying to be good. He did all his homework - and sometimes enjoyed it! He was never rude and he even encouraged sinners to say sorry. His parents were at their wits' end. So the little devil struck out on his own. On his quest to learn to be good, our little devil meets all kinds of people, from priests to police and from the Pope in Rome to Little Jesus himself. But will the angels let a little red devil with black

horns into Heaven? In these thirteen tales, clever young people find nifty ways to overcome greedy kings, wicked witches, unlucky spells and even silly names. And there's a big dash of magic to help them on the way! In these tales, the giants, witches and mermaids of traditional fairy tales leap from the page, animated by a very modern spirit. Blessed with a healthy disrespect for authority, the author took great pleasure in upsetting the natural

order of the fantastic. Analogy has been the focus of extensive research in cognitive science over the past two decades. Through analogy, novel situations and problems can be understood in terms of familiar ones. Indeed, a case can be

made for analogical processing as the very core of cognition. This is the first book to span the full range of disciplines concerned with analogy. Its contributors represent cognitive, developmental, and comparative psychology; neuroscience; artificial intelligence; linguistics; and philosophy. The book

is divided into three parts. The first part describes computational models of analogy as well as their relation to computational models of other cognitive processes. The second part addresses the role of analogy in a wide range of cognitive tasks, such as forming complex cognitive structures, conveying emotion, making decisions, and solving problems. The third part looks at the development of analogy in children and the possible use of analogy in nonhuman primates. Contributors Miriam Bassok, Consuelo B. The CEFR Companion volume broadens the scope of language education. It

reflects academic and societal developments since the publication of the Common European Framework of Reference for Languages (CEFR) and updates the 2001 version. It owes much to the contributions of members of the language teaching profession across Europe and beyond. This volume contains: ? an

explanation of the key aspects of the CEFR for teaching and learning; ? a complete set of updated CEFR descriptors that replaces the 2001 set with: - modality-inclusive and gender-neutral descriptors; - added detail on listening and reading; - a new Pre-A1 level, plus enriched description at A1

and C levels; - a replacement scale for phonological competence; - new scales for mediation, online interaction and plurilingual/pluricultural competence; - new scales for sign language competence; ? a short report on the four-year development, validation and consultation processes. The CEFR

Companion volume represents another step in a process of engagement with language education that has been pursued by the Council of Europe since 1971 and which seeks to: ? promote and support the learning and teaching of modern languages; ? enhance intercultural dialogue, and thus mutual

understanding, social cohesion and democracy; ? protect linguistic and cultural diversity in Europe; and ? promote the right to quality education for all.

The book represents a collection of papers presented at VI International Symposium "Biogenic - abiogenic interactions in natural and

anthropogenic systems" that was held on 24-27 September 2018 in Saint Petersburg (Russia). Papers in this book cover a wide range of topics connecting with interactions between biogenic and abiogenic components in lithosphere, biosphere and technosphere. The main regarding topics are following: methods for studying the interactions between biogenic and abiogenic components; geochemistry of biogenic-abiogenic systems;

biomineralization and nature-like materials and technologies; medical geology; biomineralogy and organic mineralogy; biomineral interactions in soil; biodeterioration of natural and artificial materials; biomineral interactions in extreme environment.

This Environmental Health Criteria (EHC) series publication addresses dermal exposure to

chemicals. It describes sources and pathways of dermal exposure, models and tools to estimate dermal exposure and methods for dermal exposure prevention and reduction. Furthermore, the EHC introduces skin diseases associated with dermal exposure. This EHC aims to provide information to national regulatory

authorities to assist in conducting health risk assessments and managing the risk involving dermal exposure to chemicals.

Nontraditional Careers for Chemists

Amer Inst of Aeronautics & Word problems have been a staple of mathematics instruction for centuries, yet the rationale for their use has remained largely unexamined. A range of findings have shown how students

consistently answer them in ways that fail to take account of the reality of the situations described. This monograph reports on studies carried out to investigate this "suspension of sense-making" in answering word problems. In Part One, a wide range of examples documenting the strength of the

phenomenon is reviewed. Initial surprise at the findings was replaced by a conviction that the explanation lies in the culture of the mathematics classroom, specifically the rules implicitly governing the nature and interpretation of the word problem genre. This theoretical shift

is reflected in Part Two. A detailed analysis of the way in which word problems are currently taught in typical mathematical classrooms is followed by reviews of design experiments illustrating how, by immersing students in a fundamentally changed learning environment, they

can acquire what the authors consider to be more appropriate conceptions about, and strategies for doing, word problems. Part Three turns to a wider discussion of theoretical issues, a further analysis of the features of the educational system considered responsible for outcomes detrimental to many students'

understanding and conception of mathematics, and suggestions for rethinking the role of word problems within the curriculum.

A hallmark of much of the research on children's thinking in the 1970s had been the focus on explicit content domains. Much of this research had been represented by an eclectic collection of studies sampled from a variety of disciplines and content areas.

However, in the few

years before this publication, research in several content domains has begun to coalesce into a coherent body of knowledge. Originally published in 1982, the chapters in this work represent one of the first attempts to bring together the perspectives of a variety of different researchers investigating a specific, well defined content domain. This book

presents theoretical views and research findings of a group of international scholars who are investigating the early acquisition of addition and subtraction skills by young children. Together, the contributors bring a blend of psychology, educational psychology, and mathematics education to this topic. Fields of interest such as information

processing, artificial intelligence, early childhood, and classroom teaching and learning are included in this blend.

Chemical Engineer - review of Volume 1) Food processors are under pressure, both from consumers and legislation, to reduce the amount of waste they produce and to consume water and energy more efficiently. Handbook of waste management and co-product recovery in food processing provides essential information about

the major issues and technologies involved in waste co-product valorisation, methods to reduce water and energy consumption, waste reduction in particular food industry sectors and end waste management. Opening chapters in Part one of Volume 2 cover economic and legislative drivers for waste

management and co-product recovery. Part two discusses life cycle analysis and closed-loop production systems to minimise environmental impacts in food production. It also includes chapters on water and energy use as well as sustainable packaging. Part three reviews methods for exploiting co-

products as food and feed ingredients, whilst the final part of the book discusses techniques for non-food exploitation of co-products from food processing. Provides essential information about the major issues and technologies involved in waste product valorisation. Examines methods to reduce water and

energy consumption, in particular food industry sectors. Discusses the economic and legislative drivers for waste management and co-product recovery.
